Introduction

Project Summary

The Farming Management Software, built on the MERN (MongoDB, Express, React, Node.js) stack, is a comprehensive solution tailored for farm managers and owners. This software streamlines agricultural management by providing modules for crop cultivation, livestock maintenance, inventory control, and workforce management. Its intuitive dashboard enables users to monitor crop lifecycles, input planting and harvesting dates, and predict yields. The Livestock Management module empowers users to track species, quantities, and health status, facilitating informed breeding decisions. Inventory Management ensures efficient oversight of resources, and Workforce Management offers insights into labor expenses. With security measures and a user-friendly interface, this software modernizes agricultural practices, empowering stakeholders to optimize productivity, decision-making, and sustainability.

Functional Requirements

- 1. Crop Lifecycle Tracking**
- 2. Livestock Health Monitoring**
- 3. Inventory Management and Maintenance**
- 4. Workforce and Labor Management**

Frontend Development

The front end of our web application is a seamless dashboard where users can navigate visually separate the different processes that are being tracked in the farm using cards. The user can add any tracking parameters from the card or view all the parameters being tracked for a specific field or livestock or a worker. The tracked parameters are also kept using cards for visual simplicity. The cards can further be used to Edit and Delete the data.

The image displays two screenshots of a web application. The top screenshot is the 'Login' page, which has a dark background. It features a large 'Login' title, an 'Email' input field containing 'mad@gmail.com', a 'Password' input field with masked characters, a green 'LOGIN' button, and a 'Create an Account' link. The bottom screenshot is the 'Dashboard' page, also with a dark background. It has a 'Dashboard' header with a profile icon. Below the header are four cards: 'Crop' (See Your Crops), 'Live Stock' (See Your Live Stocks), 'Work' (See Your Work), and 'Item' (See Your Items). Each card contains an 'ADD' button and a 'VIEW' button (VIEW CROPS, VIEW LIVESTOCK, VIEW WORK, VIEW ITEM).

Backend Development

The backend of the Farming Management Software, developed using Node.js and Express, serves as the backbone that facilitates data processing, storage, and communication. Leveraging the power of the MERN stack, the backend seamlessly integrates with the frontend to enable smooth user interactions. It manages user authentication, ensuring secure access to the system's functionalities. The backend handles data storage and retrieval through MongoDB, offering a flexible and scalable database solution. It also implements the logic behind various features, such as crop and livestock management, inventory control, and workforce optimization. By employing RESTful API endpoints, the backend enables the frontend to request and receive data efficiently, fostering a cohesive and dynamic user experience.

```
1 const mongoose = require("mongoose");
2
3 const WorkSchema = new mongoose.Schema({
4   user: {
5     type: mongoose.Schema.Types.ObjectId,
6     required: true,
7   },
8   jobTitle: {
9     type: String,
10  },
11  rate: {
12    type: String,
13  },
14  startDate: {
15    type: String,
16  },
17  endDate: {
18    type: String,
19  },
20  benefits: {
21    type: String,
22  },
23 });
24
```
